

**FEATURES**

- AC inputs from 100VAC to 253VAC
- 12V, 24V or 28V Output
- 200W Maximum Output Power
- Power Factor Correction
- 82% Efficient
- Operational Redundancy with two Units
- Operates from -30C to +70C
- No Cooling Fans Required
- AAR Binding Post Wire Connections

**DESCRIPTION**

The Trilogy Products 200W Power Supply is a 19” rack mount, high efficiency, switch-mode power supply that provides output voltage ranges from 12V to 14V or 24V to 28V. Any output can be achieved within the specified range by the setting of an external potentiometer. The unit operates from 100VAC to 132VAC in ambient temperatures of -30C to +60C without cooling fans. An extended operating temperature range of -30C to +70C can be achieved at inputs from 208VAC to 253VAC. Over the temperature and input voltage range and with load transitions from 10% to 100%, the SMPS will maintain the output voltage within +/-2% of nominal. The output also has a ripple voltage of less than 150mVp-p.

The SiPS-xxV-200W offers operational redundancy when paired with a second unit. This ensures that a failure of one supply will cause the entire load to be sourced from the redundant supply. In normal operation, each supply shares the load by the tuning of external potentiometers.

The SiPS-xxV-200W has several protection features to insure safe operation. These include under-voltage lockout, over current limit with auto-restart and over-voltage protection. The power supply is designed to protect itself from short circuit or overload currents and it is designed to protect the load from internal failures. The unit will reduce its output voltage when a current of 130% of maximum or greater is required due to a load failure. If the current continues to rise, the voltage will eventually reach an under-voltage condition, causing the power supply to shutdown. If the fault condition clears, the power supply will automatically begin normal operation. If it does not clear, the power supply will remain in a shutdown state.

An alarm relay used for indication and remote monitoring is also provided. The alarm relay contact will be normally closed during standard operation. If a fault exists that prevents the power supply from operating within acceptable parameters, the alarm relay contact will open.

The power supply contains digital output meters, consisting of seven-segment displays, which indicate the supply voltage and current and the bus voltage. A replaceable green lamp indicates proper supply operation. Three red LED’s representing under voltage (UV), over voltage (OV) and over current (OC) are available on the front panel. The “RESET” button on the front panel will reset the alarm relay and clear status LED’s once a fault has been fixed. The “LAMP TEST” button will flash all the displays and LED’s to provide verification of their operation. External connections for input AC and output DC are made using standard AAR binding posts. Alarm relay contact connections are made using standard barrier strip terminals.

**ELECTRICAL SPECIFICATIONS**

|                                  |                        |
|----------------------------------|------------------------|
| Input Voltage .....              | 100-253V <sub>AC</sub> |
| Output Voltage .....             | xxV +/- 2%             |
| Maximum Output Power .....       | 200W                   |
| Min Operating Temperature .....  | -30°C                  |
| Max Operating Temperature .....  | +70°C                  |
| Alarm Relay Contact Rating ..... | 5A                     |
| Output Ripple Voltage .....      | 150mVp-p               |

**MECHANICAL SPECIFICATIONS**

|              |             |
|--------------|-------------|
| Height ..... | 5.25in (3U) |
| Width .....  | 19in        |
| Depth .....  | 11.75in     |

**ORDERING INFORMATION**

SiPS-xxV-200W

**Note: xx refers to unit output voltage (12, 24 or 28)**
